BATCH B1
TEAM T4
TEAM MEMBERS:

1. Nandini — 261090700015
2. Nimith — 261090700030
3. Manjari — 261090700063
4. Sanjana — 261090700078
5. Vikas — 261090700096

PROJECT SYNOPSIS

PERSONALIZED TRAVEL COMPANION – TRIP PLANNING PLATFORM

1. Introduction

The Personalized Travel Companion is a web-based application designed to help users discover destinations and plan personalized trips according to their preferences, duration, group size, and budget. Users can search for a destination, explore destination and activity details, select their travel preferences, create a day-wise itinerary for a single destination, and estimate and track their travel expenses.

Guests can browse destinations and explore available information without registration, while registered users can log in and save and manage their trips. JavaScript is used for user interaction, form validation, itinerary handling, budget calculations, and displaying an alert when the estimated trip cost exceeds the selected budget. AJAX and JSON are used to dynamically fetch and update destination and activity details based on user selections without reloading the entire page.

The backend is developed using PHP and MySQL to manage user accounts, sessions, destinations, activities, and travel-related data. CRUD operations allow users to save, view, edit, and delete their trips. An Admin Panel is also provided through which administrators can add, update, and remove destinations, categories, and activities, keeping the information available to users organized and manageable.

2. Problem Statement

Planning a trip often requires users to search through different sources for destinations, activities, suitable places to visit, estimated expenses, and an appropriate day-wise schedule. This can make the planning process time-consuming, especially when users have a fixed budget, limited number of days, or specific interests.

The Personalized Travel Companion aims to provide these facilities in a single platform by allowing users to select one destination and generate a personalized trip plan based on their duration, group size, interests, and budget. The system provides destination information, day-wise itinerary planning, expense estimation, and trip management in an organized manner.

3. Objectives

- To develop a user-friendly platform for destination discovery and personalized trip planning.
- To allow users to search and explore destinations according to their requirements.
- To provide destination and activity information based on user preferences and interests.
- To enable users to create a day-wise itinerary for a selected destination.
- To estimate travel, accommodation, food, and activity expenses according to the selected trip.
- To display an alert when the estimated trip cost exceeds the user's selected budget.
- To allow registered users to save, view, edit, delete, and manage their trips.
- To provide an administrative interface for managing destinations, categories, and activities.
- To demonstrate JavaScript, AJAX, JSON, PHP, MySQL, CRUD operations, sessions, and form validation.

4. Proposed Modules and Functional Requirements:

Module 1 – User & Authentication Management

- User registration, login, and logout.
- Guest and registered user access.
- Session management and login-state management.
- Registration and login form validation.
- Customer profile creation and editing.
- Store and manage user information using MySQL.

Module 2 – Destination Discovery & Search

- Display available destinations with relevant information.

- Search destinations by place, category, and interests such as nature, food, adventure, shopping, heritage, and relaxation.
- Display destination image, description, category, attractions, activities, and other relevant details.
- Apply multiple search preferences to find suitable destinations.
- Provide destination details through dynamically updated results using AJAX and JSON.
- Allow users to select one destination for their trip.
- Display available activities and places associated with the selected destination.

Module 3 – Personalized Trip Planning & Itinerary

- Select trip duration and group size.
- Select preferred interests and activities.
- Create a personalized trip for one selected destination.
- Select places and activities to include in the trip.
- Organize selected places and activities into a day-wise itinerary.
- Allow users to modify the selected places and activities before saving the itinerary.
- Display the complete itinerary according to the selected number of days.

Module 4 – Budget Planning, Expense Tracking & Alerts

- Enter and manage the estimated travel budget.
- Estimate travel, accommodation, food, and activity expenses.
- Calculate the total estimated trip cost.
- Display a category-wise breakdown of estimated expenses.
- Compare the estimated trip cost with the selected budget.
- Display an alert when the estimated cost exceeds the selected budget.
- Allow users to record and track actual trip expenses.
- Display estimated and recorded expenses for the trip.

Module 5 – Trip Management & Administration

Trip Management

- Save, view, edit, delete, and confirm trips using CRUD operations.
- Maintain saved, upcoming, and past trip records.
- Allow registered users to review their previously saved trip details.
- Display complete trip information including destination, duration, itinerary, budget, and expenses.

Administration

- Admin login and logout.
- Admin dashboard for managing travel information.
- Add, update, and remove destinations.
- Manage destination categories and activities.
- Update destination descriptions, images, and activity information.
- View and maintain the travel information displayed to users.

5. Technology & Implementation

The system will be developed using:

- HTML5 – Structure of webpages, forms, and content.
- CSS3 – Styling, layouts, responsive design, and user interface.
- JavaScript – User interaction, form validation, budget calculations, itinerary handling, and dynamic page updates.
- AJAX – Fetch and update destination and activity information without reloading the entire page.
- JSON – Transfer and process destination and activity data between the client and server.
- PHP – Server-side processing, sessions, authentication, CRUD operations, and application logic.
- MySQL – Storage and management of users, destinations, activities, trips, itineraries, and expense records.
- Git/GitHub – Version control and team collaboration.

6. Scope and Limitations

The project will focus on providing a personalized travel planning system for one selected destination per trip. The system will support destination discovery, preference-based planning, day-wise itinerary creation, budget estimation, expense tracking, trip management, and administration.

The following are outside the current scope:

- Real-time GPS or live location tracking.

- Real-time traffic and route optimization.
- Online hotel, flight, or transport booking.
- Real payment gateway integration.
- Live weather API integration.
- Real-time ticket or attraction availability.
- Third-party travel service integration.
- AI chatbot or conversational travel assistant.

These features may be considered for future development.

7. Conclusion

The expected outcome is a functional and user-friendly travel planning website through which users can:

Register/Login → Search Destination → Apply Preferences → Select One Destination → Select Duration & Budget → Create Day-wise Itinerary → Estimate Expenses → Receive Budget Alert → Save/Confirm Trip → Track Expenses → View/Edit/Delete Trip.

Administrators will be able to manage destinations, categories, activities, and travel information displayed to users. The system will provide an organized and personalized approach to trip planning while demonstrating practical use of frontend technologies, AJAX/JSON, PHP, MySQL, sessions, and CRUD operations.
